Chemotherapy Protocol

GYNAECOLOGICAL CANCER

PACLITAXEL (7 day)

Regimen

- Ovary – Paclitaxel (7 day)

Indication

- Second or subsequent line treatment of platinum refractory ovarian cancer
- Ovarian cancer where the individual is unable to tolerate platinum therapy due to, for example, allergy
- WHO Performance status 0, 1, 2

Toxicity

<table>
<thead>
<tr>
<th>Drug</th>
<th>Adverse Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>Paclitaxel</td>
<td>Hypersensitivity, hypotension, bradycardia, peripheral neuropathy, myalgia and back pain on administration</td>
</tr>
</tbody>
</table>

The adverse effects listed are not exhaustive. Please refer to the relevant Summary of Product Characteristics for full details.

Monitoring

Regimen

- FBC, U&E’s and LFT’s every 21 days starting from day one of cycle one.

Dose Modifications

The dose modifications listed are for haematological, liver and renal function only. Dose adjustments may be necessary for other toxicities as well.

In principle all dose reductions due to adverse drug reactions should not be re-escalated in subsequent cycles without consultant approval. It is also a general rule for chemotherapy that if a third dose reduction is necessary treatment should be stopped.
Please discuss all dose reductions / delays with the relevant consultant before prescribing if appropriate. The approach may be different depending on the clinical circumstances. The following is a general guide only.

**Haematological**

Consider blood transfusion if patient symptomatic of anaemia or has a haemoglobin of less than 8g/dL.

Paclitaxel dose modifications occur from level zero (80 mg/m²/wk) to level −1 (70 mg/m²/wk) or level −2 (60 mg/m²/wk). For a neutrophil count of less than 1x10⁹/L or a platelet count of 100x10⁹/L or lower, with hold treatment until recovery, the subsequent weekly paclitaxel dose should be decreased by one dose level.

**Liver Impairment**

<table>

<th>Creatinine Clearance (ml/min)</th>
<th>Dose (% of original dose)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Paclitaxel</td>
<td>N/A</td>
<td>No dose adjustment needed</td>
</tr>
</tbody>
</table>

**Other**

Dose reductions or interruptions in therapy are not necessary for those toxicities that are considered unlikely to be serious or life threatening. For example, alopecia, altered taste or nail changes.

For all other non-haematologic NCI-CTC grade 2 to 3 toxicities, with hold treatment until toxicity diminishes to NCI-CTC grade 1 or lower, subsequent weekly doses should be decreased by one dose level. Patients who develop any NCI-CTC grade 3 or higher non-haematologic toxicity, those requiring more than two dose reductions, or those who required a treatment delay of longer than 2 weeks for toxicity resolution, then stop treatment.

**Neuropathy**

Patients who experience a NCI-CTC grade 2 neuropathy should have their weekly paclitaxel dose decreased by one level without interruption of therapy. For a NCI-CTC grade 3 neuropathy, with hold therapy until resolution to NCI-CTC grade 1 or lower, subsequent therapy should be decreased by one dose level.
Regimen

Paclitaxel is highly myelosuppressive and in those with poor bone marrow reserves, for example due to extensive prior treatment, bone metastasis or extensive skeletal radiation, consider a starting dose of 60mg/m² with a view to increase to 80mg/m² if well tolerated.

21 day cycle for 6 cycles

</tbody>
</table>

Dose Information

- Paclitaxel will be dose banded as per the CSCCN agreed bands

Administration Information

- Hypersensitivity reactions tend to occur with the first or second infusion of paclitaxel. Paclitaxel infusion should be interrupted for minor symptoms such as flushing or localised rashes. If these resolve promptly (within 5 minutes) the infusion may be restarted at a lower rate with intensive monitoring. Immediately discontinue the infusion for severe reactions which include profound hypotension, bronchospasm and generalised erythema.

- Paclitaxel must be administered via a non-PVC administration set containing an in-line 0.22 micron filter.

Extravasation

- Paclitaxel – vesicant

Additional Therapy

- Antiemetics
  15-30 minutes before chemotherapy
  - metoclopramide 10mg oral or intravenous
  As take home medication
  - metoclopramide 10mg three times a day when required oral

- Premedication to reduce of risk of hypersensitivity reaction
30 minutes before chemotherapy

- chlorphenamine 10mg intravenous
- dexamethasone 10mg intravenous
- ranitidine 50mg intravenous

- Gastric protection with a proton pump inhibitor or a H₂ antagonist may be considered in patients considered at high risk of GI ulceration or bleed.

Additional Information

- This is an unlicensed dosage schedule

Coding (OPCS 4.6)

- Procurement – X71.1
- Delivery – X72.1, X72.4

References
REGIMEN SUMMARY
Paclitaxel (7 day)

Day 1, 8, 15
1. Chlorphenamine 10mg intravenous
2. Dexamethasone 10mg intravenous
3. Ranitidine 50mg intravenous bolus in 20ml water for injection over two minutes
4. Metoclopramide 10mg oral or intravenous
5. Paclitaxel 80mg/m² intravenous infusion in 250ml sodium chloride 0.9% over 60 minutes

Take Home Medicines
6. Metoclopramide 10mg three times a day when required oral*

*This will only appear for dispensing as an original pack on day one. If patients require further supplies this may be added from the supportive therapies folder.
This chemotherapy protocol has been developed as part of the chemotherapy electronic prescribing project. This was and remains a collaborative project that originated from the former CSCCN. These documents have been approved on behalf of the following Trusts;

Hampshire Hospitals NHS Foundation Trust
NHS Isle of Wight
Portsmouth Hospitals NHS Trust
Salisbury Hospital NHS Foundation Trust
University Hospital Southampton NHS Foundation Trust
Western Sussex Hospitals NHS Foundation Trust

All actions have been taken to ensure these protocols are correct. However, no responsibility can be taken for errors which occur as a result of following these guidelines.
