Chemotherapy Protocol

GASTROINTESTINAL (UPPER) CANCER

CISPLATIN-FLUOROURACIL-TRASTUZUMAB

Regimen

- Gastrointestinal (Upper) Cancer – Cisplatin-Fluorouracil-Trastuzumab

Indication

- Trastuzumab, in combination with cisplatin and fluorouracil is recommended as an option for the treatment of people with human epidermal growth factor receptor 2 (HER2) positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction who have not received prior treatment for their metastatic disease and who have tumours expressing high levels of HER2

- WHO performance status 0, 1, 2

Toxicity

<table>
<thead>
<tr>
<th>Drug</th>
<th>Adverse Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisplatin</td>
<td>Neuropathy, nephrotoxicity, ototoxicity</td>
</tr>
<tr>
<td>Fluorouracil</td>
<td>Palmar-plantar erythrodysesthesia, diarrhoea, chest pain</td>
</tr>
<tr>
<td>Trastuzumab</td>
<td>Cardio toxicity, acute respiratory distress syndrome, infusion related effects</td>
</tr>
</tbody>
</table>

The adverse effects listed are not exhaustive. Please refer to the relevant Summary of Product Characteristics for full details.

Monitoring

Regimen

- Prior to starting therapy confirm a positive HER2 status

- FBC, LFT’s and U&E’s prior to day one of treatment

- Cardiac function must be assessed prior to starting trastuzumab and twelve weekly thereafter unless there are signs of cardiac impairment where four to eight weekly may be more appropriate. If LVEF drops 10 ejection points from baseline and to below 50%, trastuzumab should be suspended and a repeat LVEF assessment performed within 21 days

- Patients with complete or partial dihydropyrimidine dehydrogenase (DPD) deficiency are at increased risk of severe and fatal toxicity during treatment with fluorouracil. All patients should be tested for DPD deficiency before initiation (cycle 1) to minimise the risk of these reactions
Dose Modifications

The dose modifications listed are for haematological, liver and renal function only. Dose adjustments may be necessary for other toxicities as well.

In principle all dose reductions due to adverse drug reactions should not be re-escalated in subsequent cycles without consultant approval. It is also a general rule for chemotherapy that if a third dose reduction is necessary treatment should be stopped.

Please discuss all dose reductions / delays with the relevant consultant before prescribing if appropriate. The approach may be different depending on the clinical circumstances. The following is a general guide only.

Haematological

Prior to prescribing the following criteria must be met.

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Eligible Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neutrophils</td>
<td>equal to or more than 1.5x10^9/L</td>
</tr>
<tr>
<td>Platelets</td>
<td>equal to or more than 100x10^9/L</td>
</tr>
</tbody>
</table>

Consider blood transfusion if patient symptomatic of anaemia or has a haemoglobin of less than 8g/dL.

If the neutrophils are less than 1.5x10^9/L and/or the platelets are less than 100x10^9/L then delay treatment for 7 days and re-start treatment at the original dose. If a 14 day delay is required to allow counts to recover or there are two separate delays of 7 days during treatment the dose of the cisplatin should be reduced to 80% of the original dose.

There is little need to adjust the dose of trastuzumab for haematological toxicity.

Hepatic / Renal Impairment

Deteriorating liver or kidney function may be a sign of disease progression or drug toxicity.

Hepatic Impairment

<table>
<thead>
<tr>
<th>Drug</th>
<th>Dose (% of original dose)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisplatin</td>
<td>No dose reduction necessary</td>
</tr>
<tr>
<td>Fluorouracil</td>
<td>If the bilirubin is more than 85umol/L and / or the AST more than 180umol/L fluorouracil is contra-indicated. In moderate hepatic impairment consider reducing the dose by 30% and for severe impairment by 50%</td>
</tr>
<tr>
<td>Trastuzumab</td>
<td>No dose reduction necessary</td>
</tr>
</tbody>
</table>
### Renal Impairment

<table>
<thead>
<tr>
<th>Drug</th>
<th>Creatinine Clearance (ml/min)</th>
<th>Dose (% of original dose)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisplatin</td>
<td>more than 60</td>
<td>100</td>
</tr>
<tr>
<td></td>
<td>45-59</td>
<td>75</td>
</tr>
<tr>
<td></td>
<td>less than 45</td>
<td>Consider carboplatin</td>
</tr>
<tr>
<td>Fluorouracil</td>
<td>Consider dose reduction in severe renal impairment only</td>
<td></td>
</tr>
<tr>
<td>Trastuzumab</td>
<td>No dose adjustment necessary</td>
<td></td>
</tr>
</tbody>
</table>

### Other

Dose reductions or interruptions in therapy are not necessary for those toxicities that are considered unlikely to be serious or life threatening. For example, alopecia, altered taste or nail changes. Dose limiting toxicities include diarrhoea, abdominal pain, emesis, stomatitis, palmar-plantar erythrodysesthesia and neurosensory toxicities among others.

In general if any NCI-CTC grade 1 toxicity occurs treatment should be continued, without interruption, at the full dose. For toxicities NCI-CTC grade 3 or above, in general, treatment should be withheld until recovery to at least NCI-CTC grade 1 then re-started if medically appropriate. If recovery takes twenty-one days or longer then stop treatment.

**Cisplatin**

Neurotoxicity occurring at a NCI-CTC grade 2 or above or a new functional deterioration in hearing and / or tinnitus that does not resolve between cycles should be approached by substituting the cisplatin for carboplatin.

**Fluorouracil**

Diarrhoea occurring for the first time at NCI-CTC grade 2 should be approached by withholding the fluorouracil until it has resolved to NCI-CTC grade 1 or below. Treatment can then be re-started at full dose. Treatment should again be delayed on development of a second NCI-CTC grade 2 or above diarrhoea and the fluorouracil re-started at 75% of the original dose when it has resolved to NCI-CTC grade 1 or below. After resolution of a third episode of NCI-CTC grade 2 diarrhoea to NCI-CTC grade 1 or below, the fluorouracil should be re-started using 50% of the original dose.

On appearance of a NCI-CTC grade 3 diarrhoea withhold fluorouracil until it has resolved to NCI-CTC grade 1 or below and re-start treatment using 75% of the original dose. After a second episode at NCI-CTC grade 3 wait until the diarrhoea has resolved to NCI-CTC grade 1 or below and resume the fluorouracil using 50% of the original dose. For a third appearance of NCI-CTC grade 3 diarrhoea or the development of NCI-CTC grade 4 toxicity at any time stop fluorouracil therapy.

**Trastuzumab**

The LVEF should be fifty or above before starting cycle one of trastuzumab.
Subsequent Echocardiograms

The flow chart below describes the process to be followed if there is an asymptomatic decline in LVEF during trastuzumab treatment.

Patients who develop symptomatic cardiac dysfunction should have trastuzumab discontinued, be commenced on ACE inhibitor therapy and be referred to a cardiologist. Further treatment should be discussed with the relevant consultant.
Regimen

21 day cycle for 6 cycles

The fluorouracil and cisplatin are given every 21 days for a maximum of 6 cycles. The trastuzumab is given until disease progression. Six cycles will be set in Aria after which the single agent trastuzumab regimen should be used.

Cycle One

</tbody>
</table>

Dose Information

- Cisplatin will be dose banded in accordance with the national dose bands (1mg/ml)
• Fluorouracil will be dose banded in accordance with the national dose bands (50mg/ml)

• Trastuzumab will be dose rounded to the nearest 50mg (up if halfway)

• If the patient misses a dose of trastuzumab by fourteen days or less, then the usual maintenance dose of 6mg/kg should be given as soon as possible. Do not wait until the next planned cycle. Subsequent maintenance doses should be given according to the previous schedule

• If the patient misses a dose of trastuzumab by more than fourteen days, a re-loading dose of 8mg/kg should be given over 90 minutes. Subsequent maintenance doses should then be given every 21 days from that point

Administration Information

Extravasation

• Cisplatin – exfoliant

• Fluorouracil - inflamitant

• Trastuzumab – neutral

Other

• Central venous access and use of an ambulatory infusion pump is required

• Trastuzumab is associated with hypersensitivity reactions. Patients should be observed for six hours following the start of the first infusion of trastuzumab and for two hours following the start of subsequent infusions. If the patient has tolerated the first two infusions with no infusion related effects consideration can be given to reducing this observation period further

Additional Therapy

• Antiemetics prior to day one only

15-30 minutes prior to chemotherapy

- aprepitant 125mg oral
- dexamethasone 4mg oral or intravenous
- ondansetron 8mg oral or intravenous

As take home medication;

- aprepitant 80mg once a day oral for 2 days
- dexamethasone 4mg once a day oral for 3 days
- metoclopramide 10mg three times a day when required oral
- ondansetron 8mg twice a day for 3 days oral

• Cisplatin pre and post hydration as follows;
Pre
Furosemide 40mg oral or intravenous
1000ml sodium chloride 0.9% with 20mmol potassium chloride and 16mmol magnesium sulphate over 60 minutes

Post
1000ml sodium chloride 0.9% with 20mmol potassium chloride and 16mmol magnesium sulphate over 60 minutes

Patients should be advised to drink at least 3 litres of fluid in the 24 hours after administration of cisplatin.

- For treatment of trastuzumab infusion reactions ‘once only when required’ doses of the following should be prescribed;
  - chlorphenamine 10mg intravenous
  - hydrocortisone 100mg intravenous
  - paracetamol 1000mg oral

- Oral loperamide 4mg after the first loose stool then 2-4mg four times a day when required for the relief of diarrhoea (maximum 16mg/24 hours).

- Mouthwashes as per national or local guidelines for the treatment of mucositis

- Gastric protection with a proton pump inhibitor or a H₂ antagonist may be considered in patients considered at high risk of GI ulceration or bleed

REGIMEN SUMMARY
Cisplatin-Fluorouracil-Trastuzumab

Day One Cycle One

1. Trastuzumab 8mg/kg intravenous infusion in 250ml sodium chloride 0.9% over 90 minutes.
2. Aprepitant 125mg oral
3. Dexamethasone 4mg oral or intravenous
4. Ondansetron 8mg oral or intravenous
5. Furosemide 40mg oral or intravenous
6. 1000ml sodium chloride 0.9% with 20mmol potassium chloride and 16mmol magnesium sulphate over 60 minutes
7. Cisplatin 80mg/m² intravenous infusion in 1000ml sodium chloride 0.9% with 20mmol potassium chloride at a maximum rate of 1mg cisplatin/minute (minimum time 120 minutes)
8. 1000ml sodium chloride 0.9% with 20mmol potassium chloride and 16mmol magnesium sulphate over 60 minutes
9. Fluoururacil 4000mg/m² continuous intravenous infusion over 96 hours in sodium chloride 0.9%
10. Chlorphenamine 10mg intravenous when required for infusion related reactions
11. Hydrocortisone 100mg intravenous when required for infusion related reactions
12. Paracetamol 1000mg oral when required for infusion related reactions

Take Home Medicines

13. Aprepitant 80mg once a day for two days oral starting on day 2 of the cycle
14. Dexamethasone 4mg once a day for 3 days oral starting on day 2 of the cycle
15. Metoclopramide 10mg three times a day when required oral
16. Ondansetron 8mg twice a day for 3 days oral starting on the evening of day 1 of the cycle

Day One Cycle Two Onwards

1. Trastuzumab 6mg/kg intravenous infusion in 250ml sodium chloride 0.9% over 30 minutes (if well tolerated at 90 minutes)
2. Aprepitant 125mg oral
3. Dexamethasone 4mg oral or intravenous
4. Ondansetron 8mg oral or intravenous
5. Furosemide 40mg oral or intravenous
6. 1000ml sodium chloride 0.9% with 20mmol potassium chloride and 16mmol magnesium sulphate over 60 minutes
7. Cisplatin 80mg/m² intravenous infusion in 1000ml sodium chloride 0.9% with 20mmol potassium chloride at a maximum rate of 1mg cisplatin/minute (minimum time 120 minutes)
8. 1000ml sodium chloride 0.9% with 20mmol potassium chloride and 16mmol magnesium sulphate over 60 minutes
9. Fluorouracil 4000mg/m² continuous intravenous infusion over 96 hours in sodium chloride 0.9%
10. Chlorphenamine 10mg intravenous when required for infusion related reactions
11. Hydrocortisone 100mg intravenous when required for infusion related reactions
12. Paracetamol 1000mg oral when required for infusion related reactions

**Take Home Medicines**

13. Aprepitant 80mg once a day for two days oral starting on day 2 of the cycle
14. Dexamethasone 4mg once a day for 3 days oral starting on day 2 of the cycle
15. Metoclopramide 10mg three times a day when required oral
16. Ondansetron 8mg twice a day for 3 days oral starting on the evening of day 1 of the cycle
This chemotherapy protocol has been developed as part of the chemotherapy electronic prescribing project. This was and remains a collaborative project that originated from the former CSCCN. These documents have been approved on behalf of the following Trusts:

- Hampshire Hospitals NHS Foundation Trust
- NHS Isle of Wight
- Portsmouth Hospitals NHS Trust
- Salisbury NHS Foundation Trust
- University Hospital Southampton NHS Foundation Trust
- Western Sussex Hospitals NHS Foundation Trust

All actions have been taken to ensure these protocols are correct. However, no responsibility can be taken for errors which occur as a result of following these guidelines.
